**THAPAR INSTITUTE**  
OF ENGINEERING & TECHNOLOGY  
(Deemed to be University)

# Materials design approach

- Processing of material is very important to get desired properties.
- Properties are depend on the structure of the material.

# Levels of Structure

From smallest to largest

## Nuclear level in an atom

Nucleus spin, magnetic properties:  
NMR, Mossbauer studies

## Electronic levels in an atom

Electronic band gap, transition  
levels: UV-VIS, FTIR

Arrangement of atoms in solid material

X-ray diffraction

Neutron diffraction

Electron diffraction

- Magnification: Action of magnifying something. It refers to enlarging the apparent size and not the physical size.
- Resolution: Ability to distinguish between two different points separately

## Scanning Electron Microscopy

**Magnification:  $10^5 \times$**

**Resolution:  $2 \times 10^{-9} \text{ m}$**

## Transmission Electron Microscopy

**Magnification:  $10^7 \times$**

**Resolution:  $10^{-10} \text{ m}$**

# How grains are formed?

Melting

Solidification

Unit cells

Grains

Each grain is a single crystallite (Atoms are arranged periodically).  
Grain boundaries are amorphous in nature.

Observation with the aid of optical microscope

Optical Microscope

Magnification: 1500 X

Resolution:  $10^{-7}$  m

# Macrostructure

Everything that can be seen by naked eyes

**Magnification: 50 x**

**Resolution:  $10^{-4}$  m**

1. Structure is the internal arrangement of atoms.
2. Nuclear structure is the smallest level in the structure.
3. Macrostructure is the largest level and can be observed by naked eyes.
4. We can change the property of any material by changing its structure.

1. Name the different mechanical, thermal, electrical, magnetic, chemical, optical and physical properties of materials.
2. Mention different technological properties of metals and alloys and explain them.
3. Give five examples and applications of each of metal, alloy, ceramic, polymer, composite and electronic materials.
4. Differentiate between grain and grain boundary. Find some good micrographs showing grain and grain boundary clearly.
5. Identify the type(s) of bonding(s) present in the following materials: Graphite, Bakelite, Glass, SiC, CdS, AgCl, MgO, Al<sub>2</sub>O<sub>3</sub>, Clay, Germanium, Brass, ZnO and also give their respective applications.
6. What is the difference between macrostructure, microstructure and substructure of the material?

7. Find at least two optical microscope and SEM images of pure metals, alloys and composite materials.
8. What is the difference between an element and compound? List five elements which are metals, non-metals and metalloids.
9. Explain the difference between an amorphous and crystalline material with suitable example. Show a microstructure of any amorphous material.
10. What are composite, ceramics and alloys? Contrast between mixture and compound.
11. What do you understand by structure sensitive and structure insensitive properties of materials? Give at least three examples of each.
12. Which technique can be used to determine the substructure and crystal structure of materials? Give their resolution powers.
13. Write down the physical, electrical, mechanical properties of at least five polymeric materials.
